

ABSTRACT

At present, the use of technology cannot be counted anymore. In fact we humans can hardly be separated from the name of technology and always use technology without us knowing it. We can see the increasing use of this technology from almost all companies, schools and places of worship using computer systems. however, the Hati Kudus Catholic Church does not have an application that can help church administrators because of the lack of experts to make applications to the church. The design of the application uses a prototype system development model and uses Balsamiq Mockups as its design and Visio for an overview of program and database designs. The prototype I chose was because in the Catholic Church of the Sacred Heart there were no previous system applications so it needed a design to create the financial database application program. The results of this study are in the form of a financial database application design that has futur storing and deleting data on money in and out of the church. This application is very much needed by the Catholic Heart of the Church because there is no system in the church that can help finance.
