Background: complete basic immunization has an important role to prevent the occurrence of certain diseases. Several factors that influence the complete basic immunization is knowledge and motivation.

Aim: to determine the correlation between mother's knowledge and motivation with complete basic immunization for babies Age 0-24 Month at Work Area of Puskesmas Sosial Palembang.

Method: analytical survey method with cross sectional design. Sampling with purposive sampling of 80 respondents and data analysis is used Kendall Tau.

Result: Majority of respondents were early adult mother 58 mothers (72,5%), age group of babies (1-12 months) 53 babies (66,25%), medium education 60 mothers (75%), female babies 43 (53,75%), good maternal knowledge 67 mothers (83,75%), negative maternal motivation 42 mothers (52,5%) and complete basic immunization 46 mothers (57,5%). There is relationship with a positif direction and a strong enough association between knowledge with the provision of complete basic immunization ($p = 0,006$; $r = 0,307$). There is no relationship between motivation with the provision of complete basic immunization ($p = 0,605$). Therefore, it is necessary to increase the role of health workers to encourage mothers to complete basic immunization.

Keywords : knowledge, motivation, complete basic immunization
