(xvii + 70 pages + 3 charts + 6 tables + 12 appendix)

**Background :** Sanity is a condition which enables optimal development of physical, intellectual and emotional to be in tune with others' condition. It is estimated that 25 % of Indonesia citizen experience psychoneurotic. Schizophrenia has definite violence attitude and it requires certain treatment and care.

**Purpose :** This study aims to obtain information about the influence of strategy implementation for violence performer toward the ability to control anger in Bangau Inpatient unit Ernaldi Bahar Palembang.

**Method :** This study implementedp the qualitative research design namely *pre-experimental* design by using *one group pre-test post-test*. The sample are 50 respondents which was selected by using *purposive sampling* method.

**Result :** From the results of statistical tests performed, it was found that the mean rank given to control angry before implementation strategy 1 was 23.23 and after 10.00. The test results using *Wilcoxon* in getting *p value* = 0.001 <(0.05) which means that the hypothesis Ha no effect on the implementation of strategies for implementation 1 before and after the client's violent behavior towards controlling angry at inpatient units Stork hospital Ernaldi Bahar Palembang. Expected results of this study to be a reference nurse more emphasis on the implementation of the strategy execution in the care of patients with clients violent behavior.
