This study aims to build Distribution Information System Web-Based Product Club At PT. Prima Tirta Bahagia Method Using the Distribution Requirement Planning (DRP). Distribution Requirement Planning system is a calculation to determine the needs of the network, which involves the system to calculate the number of results during the period of distribution. Applications designed using pemrograma language with MySQL database and PHP development methods used are Development System Life Cycle (SDLC) with stages ie Planning, Analysis, Design, Implementation, Evaluation and Maintenance. This research resulted in a system that is able to manage the distribution of data, especially data items in and goods out quickly and accurately. With this system, can help PT. Prima Tirta Bahagia calculation in determining the need for the system to calculate the number of results during the period of distribution.

Keywords : *information systems, Distribution Requirement planning.*
