## **ABSTRACT**

*The need for computer technology increasingly in demand by companies in all sectors, both private companies and the government agencies. This relates to the work usually done manually by humans will be more quickly and efficiently if done by a computerized system. The main function of the computer is about processing data and information. Generally there is data or information that can be enjoyed by the public and confidential. Data or confidential information needs to be kept confidential. Often computer users careless or forget to turn off the computer because the density busy in activity, especially far away from the office. If the user returns or office to the job site just to turn off the computer would take time to go back and contact the people who are at the office or work location feared confidential data be leaked to unauthorized parties. By utilizing the advanced technology of today and the tools most commonly used by humans near the phone. One of the facilities is in mobile Short Message Services (SMS). SMS is often used as a communication tool by many people because the costs are reasonably priced and the communication can be done without regard to distance. By utilizing the facilities of SMS, mobile phones can be used as a means of controlling the remote computer. The system was designed and built with Borland Delphi 7.0 with Microsoft Access 2003 database.*
