

## ABSTRACT

Final report entitled **“Implementation of Software Betwin Cloning To Create a Personal Computer Using a Universal Serial Bus port”**. In scientific writing, the writer discusses the personal computer use cloning as a means of reducing the cost of additional computer station that is used to build a computer that is effective and useful for home or business such as rental, cafes, offices and college campuses as well as simplify maintenance and operation of hardware systems from a central processing unit.

Personal computer cloning is a technology that allows a computer central processing unit (CPU) can be used to be operated by more than one user at a time. The research method used in the manufactured of personal computers with library cloning, analysis and experimentation as well as the direct implementation. Results obtained from the manufacture of personal computers that cloning could provide cost savings and simplify maintenance and operation of hardware systems from a central processing unit used.

Keywords: Personal computer cloning, computer technology, the development of personal computers.
